Overview

I initially designed this resource to help structure my group supervision sessions, and have now set it up as an online book to share with others. It's written for supervisors as an audience, rather than for students.

Partner book

Dr Holly Neill and I have also developed a joint resource Group SupervisoR, which provides an introduction to supervising in groups and discusses different ways in which this could be done.

How the book is structured

There are a range of different resources contained within this book. In the section below, I give an overview of how I supervise and how my group supervision is structured. In the chapters that follow, I break down, week-by-week, what I cover along with the resources I use.

If you are interested in using any of these resources, please do! Feel free to pick and choose/adapt any of the resources, incorporating what you want into your own supervision practice.

Where there are internal resources that I've used, I've either linked to the original source or have said who the resource has come from. Depending on the source, these may or may not be available if you are external to the University of Glasgow. Saying that, I've made as many available as possible. Where there are external resources, I've provided the original source.

Each chapter (or week) tends to be structured as follows:

- I start with an overview of what I cover in that session
- I give a **rough** estimate of where I would typically expect students to be in their project. This is not set in stone and each project is different. It also is oriented towards projects with primary data collection, so would look different if a student was doing secondary data analysis.
- I break down what I usually discuss with students.

- If there are actions for the following week, I usually note these, to remind me to tell the students during the session
- I will then have a section at the end linking to resources I made up, internal resources (these are resources from other people within School of Psychology and Neuroscience at the University of Glasgow) and/or external resources that I pass on to students.

How I structure my supervision

The way I run my dissertation supervision is:

- Level 4 students have a combination of individual supervision and group supervision (switching between each on a weekly basis). I, personally, like having both types rather than just doing group or individual.
- PGT ODL students have individual supervision (30 mins) on a fortnightly basis (this is because they are part-time and online distance-learning). I also hold a couple of group sessions through the year to get them in touch with each other so they can provide peer support, although many work full-time or in schools etc., which combined with time zones, makes it difficult to find a time to suit everyone. I record these so everyone can benefit.

Therefore, most of these resources apply to my UG dissertation students, but could easily be applied to PGT, especially those studying on campus.

Setting expectations with students

In 2023–24, I created Sways to explain the supervision process to my Level 4 (final year undergraduate) and ODL (online distance learning) students. PDF versions are available here for Level 4 students and ODL students.

They were well received. The students who went out of their way to tell me they found them helpful were neurodivergent students, who told me that knowing what to expect made a difference. I think they would also be helpful for international students, as their previous experiences of supervision at university might have been very different.

These PDFs are the 2023–24 versions. My most recent undergraduate version is in Appendix A. Please feel free to adapt either to suit your own students.

Joint deadline document

I use a deadline document for each cohort of supervisees. This details deadlines (I keep them as soft deadlines, but others might decide to do hard deadlines) and also notes when each draft was received and when I returned feedback.

It means I can keep on top of a) where each student is in the process, b) the order in which I receive sections (and therefore have to give feedback), and c) allows students to know where their draft is in the 'queue' (which might reduce unrealistic expectations of a return within a short timescale!). I allow students to view the spreadsheet but they are not able to edit it, meaning they can't change a deadline without talking to me about it.

Examples of deadline documents:

- Level 4 students deadline document
- PGT ODL students deadline document

'Themed' supervision

I've taken an approach of doing themed sessions in supervision, covering things that everyone will need to know about and also incorporating the dissemination of resources for students. Some of these are resources I made up, some are resources from UoG SPaN staff members and others are from external sources.

Students have said they've found the resources helpful and have applied them to some of their other courses. I used to have the group sessions in the even weeks, but then some students go away for reading week, so I've moved them to the odd weeks.

The below structure is based on a dissertation starting in September (Semester 1 Week 1) and ending in marly to mid-March (Semester 2 Week 9). This is likely to differ based on discipline and University.

In my School, we usually have the dissertation submission in Week 9 and the UG conference in Week 11, but this has been pushed forward by one week in 26/27 due to the Easter Bank Holiday.

Level 4 group supervision is as follows:

- Semester 1 Week 1 - Getting to know each other, topics, proposals
- Semester 1 Week 3 - Ethics, research questions
- Semester 1 Week 5 - Summarising papers, writing, bullet point introductions

- Semester 1 Week 7 - Discussing the bullet point intros (*students to bring bullet point intros*), participant recruitment, reducing perfectionism

- Semester 1 Week 9 - Collecting data, developing evaluation (intro)

- Semester 1 Week 11 - Structure (i.e. reverse outlines), JARS guidelines
- Semester 2 Week 1 - Receiving and applying feedback, presenting work
- Semester 2 Week 3 - Analysis (quant and qual) - *students to bring questions*
- Semester 2 Week 5 - Developing evaluation (discussion), peer review of discussion
- Semester 2 Week 7 - No-stakes presentations - *all students will present a 5 min summary of study findings so far*
- Semester 2 Week 9 - Final group session - *students to bring questions*
- Semester 2 Week 10/11 - LONGER SESSION - celebration and practice talks for UG conference/BPS. *Students to bring presentation slides*

I do individual supervision in the even weeks, and do 30 mins per person. Other models used are to do group supervision every week or some do one week group supervision, one week drop-in.

1 Semester 1 Week 1

1.1 Getting to know each other, topics, proposals

In the first session, the purpose is mainly to get to know each other - what topics are students interested in? We also have a look over what is required for the dissertation proposal and discuss what they can expect as part of supervision.

1.1.1 Introductions and topics

- Everyone introduces themselves and the general topic/s that they are interested in. Do they have a fixed idea or are they still deciding? Do they know what approach they want to take, methodologically? Do they have any questions?

1.1.2 Format of supervision

- I then discuss the general process of supervision
  - Expectations I have (stated in the sway) and what students can expect from me
  - Individual vs. group sessions (including how these differ, what the function of each is)
  - Explain the importance of getting ethics done at an early stage in the process
  - Discuss a general timeline of the project (everyone's will look a bit different though)
    - Typically, intros are sent in December/early Jan, methods in Jan/Feb and Results or Analysis in Feb.
    - Sections can be sent together or separately.
    - Everyone should choose deadlines for each section and it will be added to the deadline spreadsheet.
    - I have a cut off for accepting drafts. This is usually two weeks before the deadline, so students should keep this in mind when setting deadlines (they should give themselves some wiggle room).

  - Show the students the folder with dissertation resources I've gathered together. This will be everything covered in the group sessions, plus anything else that's useful

  - Show students the spreadsheet to track drafts etc. We'll discuss possible deadlines in individual supervision
  - They will have to juggle the dissertation alongside other courses, so will need to work consistently on it but also take advantage of the quieter periods to work on it.

- Some things I cover, in terms of project management:

  - It's worth setting up a reference manager now if they don't already use one (e.g. Zotero)
  - Project management will be very important - there's information on using Planner in the Moodle

1.1.3 Writing a proposal

Different supervisors have different ways of approaching the proposal - as most of the students working with me tend to do somewhat sensitive topics, I am very mindful of not delaying ethics too much and therefore ask them to work on the proposal and also make a start on ethics pretty soon after. But, they would need to have a very clear idea of the project and how they were going to set it up in this case.

Some things I discuss with students and ask them to think about:

- Why are they conducting the study?
- What do they want to find out? - What data will they need?
- Who are they going to recruit? From where?
- What would your RQ/hypotheses be?
- If quant, what analysis would you do for each hypothesis?
- If qual, how are you planning to analyse your data and why?

I also direct the students to the information on proposal writing on the Moodle.

1.1.4 Other things to cover

- I show the students where the Dissertation-specific Moodle is (usually there are at least a few who aren't aware of this)
- I introduce the idea of deciding between College vs. intranet for ethics (which route we go down will depend on their project)
- Mention that one things I'm doing is building up a bank of data that future students can use. Ideally, I would like all projects that collect data to have an option in it for storage of the data and keeping it so students can analyse it in the future.

2 Semester 1 Week 3

2.1 Ethics, research questions

In this session, we talk about ethics and research questions. Most people working with me tend to submit their projects through College Ethics rather than the intranet, and so I focus on the importance of getting ethics submitted quickly as delays can hold projects up. There is more wiggle room if supervisors are supervising low-risk/secondary projects.

2.1.1 Expected progress

- In Week 3, I would expect that students are firming up their research questions and what their data collection/analysis will look like and have made progress in the proposal.

2.1.2 Research Questions

- I usually talk through some tips for developing a Research Question (quant and qual) as well as hypotheses (quant only), using resources from RM1 and RM2 (MSc Conversion courses) *see internal resources below.*

2.1.3 Ethics

- Generally I will aim for ethics to be submitted around Week 6 (final submission, not submission to supervisor)
  - Given this, when will we set as a deadline to get an initial first draft of ethics to supervisor? This date is then added to the spreadsheet for each student. Need to allow time for supervisor comments and student time to act on feedback.
    - May need multiple drafts before ready to submit.
  - What concerns do students have about ethics?
  - Discuss whether each project is likely to be internal ethics (low-risk) or College ethics (higher-risk/potential to publish) so students are clear on what they are expected to do.

- I will then ask students to make sure that they use the resources linked on the moodle for their ethics (templates and examples are available) and show them where this is.
- There is one final resource available to them: commented versions of ethics applications from previous student projects (one quant and one qual).

2.2 Internal resources

2.2.1 Developing a research question

Chapter 3.1 of the Research Methods 1: Writing Resources book has some tips for students on how to construct Research Questions and hypotheses for quantitative research

Chapter 8.2 of the Research Methods 2 book has some tips for students on how to construct Research Questions for qualitative research

3 Semester 1 Week 5

3.1 Summarising papers, writing, bullet point introductions

In this session, we cover summarising papers as well as general writing advice before specifically covering bullet point introductions. I then ask students to bring a bullet point introduction with them into the Semester 1 Week 7 session.

I've made some notes for this session. Feel free to use/adapt etc. as you wish. These notes are also included in each collapsible section below.

3.1.1 Expected progress

- By now, I would be expecting to see some ethics drafts coming in and all projects should be firmed up. Rationales should all be submitted.

3.1.2 Summarising papers

- I cover some suggestions that I have on how to summarise papers
  - Summarise with intent (what is the purpose?)
  - Pull out the key details (remember can go back for further detail)
  - Take notes for the Discussion, even when reading for the Introduction

> **i** What I discuss with students: Summarising Papers
>
> **Reading and note-taking**
>
> - Identify what the key points/findings/arguments are
> - Remember to avoid closely paraphrasing the original – when taking notes, try to think about how you would summarise it for someone who has never read the paper.
>
> **Judgement calls (weight and evaluation)**
>
> - Try to avoid summarising every single detail, as then it can become too lengthy. Remember that you can refer back to the paper if you need to.

  - Have a focus for the summary – what is your purpose?
  - Help build a rationale?
  - As background in the intro?
  - Linking to theory?
  - To link to findings in the Discussion?
- Go beyond description and evaluate. What is great about the study? What is not-so-great? Why? What does this mean for how we interpret the study? How confident can we be with a study's conclusions?
- Some papers will be more relevant (and therefore will have a longer summary) than others. If a paper seems great in terms of topic, it's not necessarily important to include in great detail if it's methodologically weak.

Working across papers

- Once you've summarised a few papers, take a step back and consider how they relate to each other.
- Look at where they agree/disagree/build on each other. When you write your dissertation, then keep this in mind: you want to think of the 'bigger picture' and synthesise, rather than producing study 1 -> study 2 -> study 3 -> conclusion.

Reading while being aware of later sections

- Even when reading papers in preparation for the introduction, keep an eye out for anything that might be useful for your Discussion.
- I keep a document specifically for the Discussion and take notes from my reading as I go. I don't use all of these at the end, but it means I have some thoughts written down and don't have a blank space (which can be a bit overwhelming).

3.1.3 General writing advice

- Writing advice will likely differ from supervisor to supervisor. Here are some of my suggestions:
  - It's better to write something than nothing
  - Know what works for you (e.g. timing, accountability, blocking time out)
  - Small goals can be helpful
  - Split out **generation** and **editing**
    - This can help get over the hurdle of the 'perfect' sentence

What I discuss with students: Writing Advice

- It's better to write something/anything than nothing.
  - Be accountable to others
  - Body doubling can be useful
  - Block out time in your calendar
- Give yourself small goals, e.g. ten minutes of writing.
  - It makes it easier to get started. If I was really struggling, I would write down what I was struggling with. Sometimes, just typing something was enough to get me into it, even if I'd spent the first five mins writing 'I don't have a clue what to write about'
- If writing feels like the wrong tool that day, try talking it through instead – to a supervisor, a friend, or just to yourself. Saying it out loud can help you identify the structure of an argument faster than staring at a blank page
- Know yourself (do you write better in the morning or at night?)
  - I am better at creative things in the morning, so during my PhD I used to write every morning from 9-1, then the afternoon was spent doing things that didn't need my brain as much. Within the schedule you have, think about what might work for you
- Writing out of order
  - You don't have to write in the order it'll be read in – if you're stuck on the intro, try starting with a different section (e.g. Methods) that feels more concrete. Getting words down anywhere builds momentum to go back to the harder sections later
- I used to get hung up on every single sentence. What helped me was splitting the process of generation and editing
  - Generation - just focus on getting words on a page. Don't worry about spelling, looking papers up, grammar, punctuation, structure etc. It's about getting the ideas down.
  - Editing - later (give yourself some time between this stage and the generation stage), focus on getting the things you wrote into a coherent draft.
  - To do this, try to split it into two stages:
    - first, check the structure (does the argument hold together, is anything in the wrong place or missing),

    - then focus on the line-level parts (grammar, word choice, polishing sentences). This then means you only polish those parts that seem likely to 'stick around' and make it past the first round of editing.

3.1.4 Bullet point introductions

- I discuss that I would like everyone to write a bullet point introduction for the next session. I tell students that I do not expect this to be perfect, and that it can change down the line
- We go through some of the suggestions I have for writing this.
- I ask students to post on the Teams channel before the next group meeting (in two weeks time) but others may choose a different process
- I signpost them to Wil Toivo's resource on developing a rationale for their introduction.

i What I discuss with students: Bullet Point Introductions

- Set the scene for the reader
- Do the different paragraphs flow well?
- A good structure starts off broad and ends narrow (i.e. closer to your study)
- It can be helpful to use sub-headings, especially if you are covering literature from quite different areas
- Try to synthesise literature (i.e. pull together literature from various sources, rather than concentrate on a study per paragraph)
- Be selective about which literature makes the cut, not just how much detail each gets (i.e. not everything that is interesting needs to be in the intro)
- Is there a theoretical basis for your research?
- Identify the gap – what's missing, unresolved, or contested in the literature – but remember to think about why it matters. "No one's studied this" isn't a justification on its own; ground the "why" in what's already known or unresolved, not in what the findings might lead to (save future implications for the Discussion)
- Try drafting your RQ/hypotheses first, even roughly – then check each bullet point is actually building towards it, rather than just being interesting background
- End your introduction by presenting your RQ (qual) or your hypotheses (quant)

3.2 Internal resources

My suggestions on summarising papers, writing in general, and developing a bullet point intro

Wil's resource on developing a rationale

Academic writing tips for quantitative research (from the RM1 team): Chapter 4

Academic writing tips for qualitative research (from the RM2 team): Chapter 7

3.3 External resources

Here's an example of a template for summarising a paper, which can be helpful for students if they want some guidance on where to start.

Document link

4 Semester 1 Week 7

4.1 Discussing the bullet point intros, participant recruitment, reducing perfectionism

In this session, we go through everyone's bullet point intros. These are usually between half a page and a full page of A4, and don't need to be concrete.

We'll then cover participant recruitment. If we have time, we'll look at reducing perfectionism and discuss this as a group. If the bullet point intros take longer than expected, I'll pass the resources on to the students to review outside the session.

4.1.1 Expected progress

- Around now, I would expect most ethics applications to be submitted (or in the final stages of draft) (especially if it's going through College)
- Students will have made a rough outline of their introduction and will have done background reading
- I will usually ask students to pick a deadline for their Introduction around now, adding it to the shared deadlines spreadsheet

4.1.2 Bullet point introductions

- We then spend most of the session discussing the bullet point introductions.
  - Each person talks about their project and what they currently think about for their introduction in terms of structure
  - To help students engage rather than defaulting to silence, I sometimes give each listener something specific to focus on (e.g. one person listens for the gap, another for structure, another for flow), rather than just asking "any questions?"
  - I ask students to jot down a line or two on each presentation, even if they don't ask something aloud, so the presenter has more than just what was said in the room to reflect on afterward
  - I will then give some feedback on these and students can also ask questions etc. For the first presentation, I try to model what I'm listening for out loud, so the group has a sense of what to listen for with the rest

  - It's quite a good opportunity for the whole group to understand what everyone is doing for their project

4.1.3 Participant recruitment

- If we have time, I will cover participant recruitment first, then reducing perfectionism
  - It's important that students' recruitment plans match what is going through ethics - do they?
  - Do they have a target number in mind, and is it grounded in something (e.g. a power calculation, or previous research for qualitative work), rather than just "as many as I can get"?
  - What are students' plans for recruitment?
  - Do they foresee any difficulties? If so, is there anything we can put in place now to mitigate these?
  - Things to think about:
    * When do participants need to be secured by, to leave enough time for data collection, analysis, and writing afterward? Students often underestimate how long recruitment itself takes
    * What are the backup plans? What if the students need to recruit more people?
    * Are any gatekeepers needed?

4.1.4 Reducing perfectionism

- I talk about perfectionism and how it can be quite a big barrier in terms of not wanting to 'let go' of things
  - Remind students that a draft is just that: a draft. It's not the final version and doesn't need to be seen by anyone else.
  - Sometimes what *looks* like wanting to polish something further is really about not wanting to show unfinished work to someone else. It's worth talking about this openly (I've experienced this myself), as a student who's worried about being judged needs something different from one who's genuinely trying to perfect every single sentence.
- I talk about my own experiences of it as a student and what I found helped me:
  - Breaking things into small chunks
  - Reminding myself that feedback will help make it stronger in the end
  - I remind students that a published paper is the end result of several rounds of revision and editing they never see. Comparing an early draft to that finished version isn't a fair comparison, and no one, including the paper's authors, got it right first time. Again, I have many examples from my own work I can discuss!

  - Students have a finite amount of time - if they spend ages perfecting one section (e.g. the intro), this is time not spent on other sections that also need to be strong (e.g. the discussion). Sometimes, we see Discussions that are rushed, and it's often because the focus has been imbalanced between the sections.

- I tend to add the below external resources to Teams for students to engage with if they want

4.2 External resources

Dr Carolina Kuepper-Tetzel found these resources on Perfection Paralysis on the Hidden Curriclum website (contains lots of useful resources)

5 Semester 1 Week 9

5.1 Collecting data, developing evaluation for the introduction

In this session, I tend to cover data collection (i.e. trying to pre-empt any issues before they happen) and also developing evaluation of the Introduction section. I usually have both quant and qual projects so cover both types of data collection - I would only cover one though, if students were only doing one type. We then cover evaluation in Intros using some resources that Wil and I developed for our Research Methods 2 course. (Discussions are covered in Semester 2 Week 5)

Although I cover data collection in Week 7 (if I have time), that was an initial discussion to put it at the forefront of their minds and this is more in-depth, as they should be close to having ethics approved if they don't already.

5.1.1 Expected progress

- By now, ethics approvals should be imminent or through already
- Some students may have already started data collection, or might be getting materials together in anticipation of starting
- If doing secondary data analysis, the timeline is a bit less pressured
- Students should be working on introductions

5.1.2 Data Collection (Quant projects)

(N.B. I only supervise survey-based quant projects, so my notes refer to this only)

- How is data going to be collected (e.g. Qualtrics?). Student should use university email, not personal email for account.
  - Even if ethics isn't through yet, can still familiarise themselves with it.
- Are students clear on how to present their study on whichever system they are using?
- Test, test and test again

  - Check the platform's default settings for things like IP address or location tracking – some of these are switched on by default and can undermine anonymity even when ethical approval assumes an anonymous survey
  - Where possible, pilot with a few real people (e.g. friends, coursemates) before sending it to me to test, not just testing it themselves. Some problems (confusing wording, unexpected timing, issues on a different device or browser) only show up once someone unfamiliar with the study tries it.

> ⚠ Mistakes I've seen before
>
> - One student had to start data collection from scratch after not noticing, until midway through, that their scale order was inconsistent: Strongly Agree - Disagree - Neither agree nor disagree - Agree - Strongly Disagree
> - On another project, participants saw one of two pictures (the between-subjects condition), but it wasn't clear from the data which picture had been shown, so data collection had to start again

- I emphasise to students that they should not start data collection without extensive testing and I reiterate to let me know when it is ready for me to look over. Other supervisors may differ on this, but it's caused issues in the past (see examples above).
- Students need Emily's extended debrief if going to recruit Level 1 students (within our School, anyway)

5.1.3 Data Collection (Qual projects)

- How are students collecting data?
  - If online, must use GDPR-approved system (e.g. Teams)
  - If in person, will need a) appropriate recording equipment, b) a quiet space
  - Where possible, have a backup recording method running (e.g. a second device), in case of equipment failure. Unlike quant data collection, it is unlikely that you can repeat the session with the same participant if something goes wrong
- Some supervisors differ on their opinions on this, but I ask students to send out questions in advance for all participants, as it can be more accessible for certain people (e.g. those who are neurodivergent or who don't speak English as a first language)
- How and when will consent be reconfirmed at the start of the session? I ask students to capture a verbal confirmation on the recording itself, rather than relying only on a form signed beforehand. We also discuss ongoing consent (i.e. checking-in throughout the interview/focus group)
- If students are recording on a stand-alone device (e.g. audio recorder), ensure that recordings are transferred to secure, university-approved storage as soon as possible after the

session, rather than left sitting on the device itself. Data needs to be deleted off the device as soon as possible.

- I ask students how they are feeling about collecting data. Typically, they can be a bit nervous
  - Important to practise setting things up/recording etc.
  - Good to pilot things (e.g. with a friend). I'm also happy to help in office hours etc.
  - Can practise with each other (i.e. others in the group) to help get comfortable
  - Can be helpful to write a list of everything need to cover at the start and end so that they don't forget anything
  - It's also worth asking whether students have thought about how they'd handle a participant becoming upset or wanting to stop partway through, particularly given some topics may touch on sensitive experiences. It's good to anticipate this, so it isn't something they're figuring out for the first time in the moment.

5.1.4 Evaluation in introductions

In RM2, Wil and I have made some excerpts from intros and discussions for our labs. In today's session, I only cover intros and do discussions in a later session (Semester 2 Week 5). Materials can be downloaded from here.

We use a fictional topic (zombie apocalypse survival confidence) rather than examples from students' own dissertations, so no one's real topic ends up coming up, and the focus stays on structure and argument rather than content.

I show students the "not so good" paragraph first and ask them to have a go at improving it themselves (individually or in pairs) before I reveal the stronger version, so they're practising the judgement rather than just recognising it once shown. We then have a discussion about it.

This resource has 'not so good' examples, then 'stronger' examples and then notes for things to look out for and finally some tips. The three things we look at are:

- Synthesising evidence
- Focused criticism
- Why is your study worth doing? – this reinforces the same point from the bullet-point intro session: just because something hasn't been done before doesn't make it worth doing on its own

At the end, I ask students to look back at their own reading notes so far and identify one place where they've been describing one study in detail, rather than synthesising across sources, and one criticism from the literature that their own study could specifically address. This gets them applying the three lenses to material they already have, without needing a finished draft.

6 Semester 1 Week 11

6.1 Structure (i.e. reverse outlines) and JARS guidelines

This is the final group session I run in Semester 1. It's good to touch base and see where everyone is at in their projects, as things tend to start winding down (especially recruitment-wise) for the festive period.

In this session, I cover structure (specifically thinking about reverse outlines, so that larger structure of a document) and we also discuss the Journal Article Reporting Standards (JARS).

I tend to reiterate to the students how important it is to get some rest over Christmas, and what they are looking forward to in Semester 2. I also mention the BPS conference and ask them to have a think about presenting there next semester.

6.1.1 Expected progress

- I may have seen a few intros at this point, but it's likely students are still working on these.
- Some students will usually have started data collection.
- Hopefully all ethical approvals should be back by now

6.1.2 Structure

- I mainly cover structure between paragraphs rather than within them here, but if you wanted to cover structure in a paragraph, there are some useful resources in the Research Methods 1 book PEEL (Point, Evidence, Explain, Link) - see Chapter 4.2. Where PEEL checks whether a single paragraph is doing its job internally, reverse outlining (below) checks whether the paragraphs collectively build the right argument once you strip away the detail, so the two operate at different levels of the same structural problem.
- I use the Reverse Outlines resource to discuss reviewing structure of a particular section (e.g. the Introduction).

- The method itself: number each paragraph, then write down its topic in just a few words (not the content, just what it's doing). Once they have that stripped-down list, that's what they examine.
- Some things we discuss:
  - a broad –> narrow structure can be helpful for the introduction (and the reverse for the discussion)
  - are they covering one main point per paragraph or trying to squeeze too many in?
  - I ask students to think about the reader when writing - what do they know at each point? Who are they? In my discipline, we suggest the second marker of the dissertation, or someone familiar with Psychology, but not the topic.
  - Looking at the order: does their reverse outline make sense? For example, does it jump around between topics or does the structure flow clearly?
  - Looking at proportion, separately from order: is space being given according to importance, or is a minor point getting a long paragraph while something more central is squeezed into a couple of lines? This is the same point made in Sem1 Wk 5, but instead thinking about the full section.
  - if covering quite disjointed topics in the intro, it might be worth considering using sub-headings

6.1.3 Journal Article Reporting Standards (JARS) and other resources

- In the second half of the session, we cover JARS guidelines. These are very useful, particularly for the methods sections and often results too (there tends to be less guidance on intro/discussion).
- The guidelines give some insight into what students might want to include, and has some suggestions for people who would be reviewing an article (i.e. what might they look for) which are useful to know. This is the same 'keep the reader in mind' perspective we introduced earlier in this session (the second marker, or someone familiar with Psychology but not the topic), but applied here to methods rather than structure
  - Journal Article Reporting Standards (Qual)
  - Journal Article Reporting Standards (Quant)
  - Journal Article Reporting Standards (Mixed Methods)
- In addition, there have been Journal Article Reporting Standards for Race, Ethnicity, and Culture released
  - Journal Article Reporting Standards (Race, Ethnicity and Culture)
- It's worth being clear with students that JARS describes what a published journal article should report. This isn't the same as our marking criteria, even though there can be a lot of overlap. If the two ever diverge, our formal marking criteria takes priority. In the session, I frame JARS as good general practice for what belongs in a methods section,

but with the caveat that the priority should be what the marking criteria, guidance from the course lead, supervisor says.
- As most of my research has been in autism, if I have any students working on this topic, I share a resource by Bottema-Beutel et al (2021) on avoiding ableist language

Activity: Apply JARS to a real methods section

- Choose a methods section in advance, either from a paper on the group's reading list or the one used for the reverse outline exercise earlier in this session
- Ask students to open the JARS checklist that matches its design (Quant, Qual, or Mixed)
- Ask students to go through the checklist and note what's reported and what's missing
- Ask students: if you were reviewing this for a journal, would you have enough information to understand exactly what was done, and in principle, replicate it?

7 Semester 2 Week 1

7.1 Receiving and applying feedback, presenting work

In this session, we see where everyone is now that we are back for Semester 2 (and the deadline will suddenly be around two months away!). I cover receiving and applying feedback in this session, as well as presentation research.

At the end of the session, I tell students that the next group session is on analysis and ask them to bring any questions they have in for the session so we can cover them together.

7.1.1 Expected progress

- Students should have submitted or be not too far off submitting a draft of the Introduction for feedback. They should also be working on their Methods.
- Students should be recruiting participants by now

7.1.2 Receiving and applying feedback

- As part of the group session, I talk about the type of feedback I give (i.e. what students can expect when they receive feedback from me).
- I also tell them how they can get the most out of the feedback that I give (e.g. asking questions after receiving it, leaving comments in their work for me to respond to)
- This will be individual to each supervisor, but I've provided a summary of what I discuss with the students below. I don't give them this, but it has the main things I talk about in the discussion.
- I also cover a few, select, parts of the external resources linked below and we discuss how they might be able to apply these to their work in semester 2.

> **i** What I discuss with students: Feedback
>
> This is also available as a Word doc
> **The main type of feedback that you will receive from me for any drafts will be:**
>
> - In-text, and will either say what you did well, will say what could be improved or

will ask a question
- I may point out one or two examples of things that could be improved throughout the draft – this does not mean that the ones I chose are the only examples. Try to look at the things I am saying and see if you can spot other examples. Often, this is to do with succinctness of writing, or overly using long/short paragraphs. I might give you an example of how you could cut out information you don't need, but it would be very repetitive to go through your whole draft with this level of detail. If I've raised both structural comments (e.g. in the overall summary) and smaller wording-level ones, tackle the structural changes first – there's no point polishing a sentence in a paragraph that might end up moving or being cut
- If you are confused by one of my comments, think about why I might have made it, e.g. is it that you made a particular point, but it could be clearer? Did you cover it but somewhere else?
- I will also give an overall summary comment I'll provide the main things you do well and the main things I think it would be good to focus on. It's likely that I'll have covered these in more detail in the in-text comments
- You might disagree with some of my feedback and that's okay! However, I encourage you to discuss it with me and I'll try to explain why I read it a particular way. You might then either decide to keep it as is or make some sort of change to make your intentions clearer.
- Try not to read the number of comments as a verdict on how good or bad the draft is. A heavily annotated draft usually just reflects how closely I've engaged with it at that stage, not how badly you've done, in the same way a published paper you read has been through far more rounds of revision than you ever see

To help you get the most out of my feedback:

- Read through all the comments once, in-text and the summary, before you start making any changes. That way you've got the full picture before you act on anything, rather than responding to an early comment in a way that gets contradicted or made unnecessary by something raised later in the same draft
- If you have a question for me when drafting (before I read your draft), leave a comment in word at that particular point in the draft, so I can see it and respond to it when I read it. Try to avoid putting it in your teams message/email as I don't always remember to go back to these when reviewing.
- Ask me any questions you have once you've received it. I'm very happy to explain any feedback in individual supervision or my office hours – it's hard to get everything across clearly in writing and it sometimes will need a brief clarification/discussion in person.

7.1.3 Presentations

- I've noticed that quite a few students I supervise are nervous about presenting, so I talk to them about how they feel about it.
- We discuss presenting their dissertation research, and I encourage them to take the opportunity to present when they get it. Although it can be anxiety provoking, it helps equip them with useful employability skills
- I then highlight the Level 4 conference at the end of the semester, and the BPS conference that is usually at the end of March/beginning of April. I tell students that to support these, we will a) practice running through findings in the group (week 7) and we will b) book out a room to do a proper practice with slides (usually around a week before the UG conference). Both of these are no stakes and the purpose is to help students practice communicating their research in a safe environment.
- We then discuss some of my tips for this (caveat: others may disagree) and together we plan out some concrete actions of what they could do to improve their experiences of presenting.

i What I discuss with students: Presentations

This is also available as a Word doc
Suggestions for students:

- Keep to time (don't go over your allocated time). It's better to be slightly too short than slightly too long.
- If you know people in the audience, it can help to make eye contact with a friendly face if you're feeling nervous during the talk or the questions afterward.
- You don't need to include everything – what does the reader need to know to give them background/a context? What do they need to know about what you did and how? What do they need to know about what you found? What do they need to know about how your findings relate to the literature and why they are important?
- Don't include lots of text on slides – it's better to have clear slides that aren't cramped and cluttered.
- Signpost as you go (e.g. "so far I've covered X, now I'll move on to Y") – unlike a reader, your audience can't scroll back if they lose the thread, so a quick verbal marker at each transition helps them follow along.
- Don't use lots of different animations/super bold colour combos – stick to one type of animation only and aim for readability.
- Try to use quotes/plots/tables to help you get key info across.
- Know what you do when you get anxious and try to manage it (e.g. I speak really quickly so I have to consciously slow down).
- Practice your talk! It's less about memorising it and more about practicing the structure etc./what you want to discuss at each point.
- Ask for feedback from other people – it's helpful to see what people found help-

ful/less helpful.

- Have some bullet point notes but try not to read out a script on stage from a piece of paper.
- It can help to think through your study's weak points in advance and have a rough sense of how you'd respond if asked about them – you've already practised spotting this in other people's papers, so turn that same eye on your own study before the talk.
- If you think you might be asked questions on a particular area, you can prepare slides that respond to this (e.g. figures) that you didn't have space for and keep them after the 'final slide'. If you then get a question on this, it can allow you to expand on areas you might not have had time for in the talk and also can set you at ease for the next few questions.
- It's also completely fine to say you don't know, or that it's something you didn't look at, if you're asked a question you can't answer. Don't feel like you have to guess or bluff your way through it

7.2 Internal resources

Guidance on the type of feedback I tend to give for dissertations

Guidance on presentations

7.3 External resources

There are a few useful resources targeted at helping students get the most from feedback. We can't cover it all, so I tend to show students some parts of how to practically apply feedback in group supervision and we discuss it (e.g. SNOB analysis in the Salford document, Action Planning in the 'AdvanceHE Student Guide).

I always highlight that they are in fourth year and so will be used to applying feedback, but that it can be useful to consider how they might further improve things.

8 Semester 2 Week 3

Note: In 26-27, I will combine Semester 2 Week 3 and 5, pushing things forward. This is because the dissertation deadline is earlier than normal, due to the early Easter Bank Holiday in 2027

8.1 Analysis (quant and qual)

In the previous session, I would have ended the group meeting by asking students to bring in their analysis questions. Discussing these questions takes up most of the session.

In the rest of the session, I cover the following: a) if I have some students doing qual, I cover an example of getting depth in analysis, b) I remind students doing quant about the PsyTeachR resources and c) I provide some excerpts of Results/Analysis sections from previous student work (all anonymised) and give these to the students to have a look at. The last one tends to generate a bit of discussion.

8.1.1 Expected progress

- I would be expecting all intros to be submitted by this point, plus to have had a few methods submitted
- Data collection should be wrapping up imminently if not already completed
- Students should be writing up Methods if not yet submitted
- Those doing qual projects should be working on transcripts and have a cut-off for recruitment/data collection
- Those doing quant projects should be working on setting up their .rmd and getting set up for analysis

8.1.2 Questions

Most of today's group session will be answering questions from students on analysis. I think I had a mixture of ones that students had posted on teams (with me saying I'd answer in the group session) and others that were asked only in the session.

The students found it a useful experience, even if they hadn't thought much about it as those who were a bit further behind got answers to questions they hadn't thought of yet. I encourage students to submit something even if it's not a fully-formed question, e.g. "I don't know where to start with X" is a valid thing to bring, since a vague sense of being stuck is still worth raising rather than students feeling they need a polished question before they can ask anything.

8.1.3 Qual resource

For any qual students, I give them Activity 2 from Lab 9 in RM2, and ask them what they think about the depth. I then ask them to reflect on their own analysis so far, is it reaching a similar depth, or are there places it's currently more surface-level?

8.1.4 Quant resource

For any quant students, I remind them about the PsyTeachR resources. Although they will be aware of the books they had in Levels 1 through 3, they will be less likely to know about the MSc resources. Over the past few years, I've had students find the MSc Conversion book useful, in particular.

8.1.5 Looking over excerpts of results/analysis

- Before the session, I will have prepared some results/analysis extracts from previous dissertations. I then give these out during the session and we discuss:
  - what they liked/what worked well
  - what they felt could be improved
  - one concrete thing that they might take forward when they come to write their own analysis section

I also flag that these are not all A1 examples. The students usually say they are surprised by how different they are, and this leads to a discussion about key things being covered but it's not 'one size fits all'. This is the same critical-reading skill running through the whole book, spotting what's strong and weak in someone else's work, first with papers back in Week 5, then the zombie apocalypse intros in Week 9, then JARS in Week 11, just now applied to Results and Analysis sections.

8.2 Internal resources

MSc Conv ODL (RM2 ODL)

9 Semester 2 Week 5

Note: In 26-27, I will combine Semester 2 Week 3 and 5, pushing things forward. This is because the dissertation deadline is earlier than normal, due to the early Easter Bank Holiday in 2027

9.1 Developing evaluation in the discussion, peer review of discussion

In this session, we concentrate mainly on Discussion sections. I cover evaluation using the resources from the RM2 lab (Introductions were covered in Semester 1 Week 9). We then use this as jumping off point to talk about their Discussions. We then discuss peer review of Discussing sections.

At the end of the session, I remind students that the next group session will be no-stakes presentations on their initial findings (no need to have completed analysis). There are no slides and they should prepare to talk for 5 mins.

9.1.1 Expected progress

- Projects should be finished in terms of data collection and analysis ongoing
- I would be expecting Methods sections to be submitted by now (unless the student is submitting it alongside results/analysis)

9.1.2 Evaluation in discussions

- Here, I show the students the poor and stronger versions of excerpts within Discussions and we then have a chat about what they think. This is the same critical-reading skill we've been building all year, spotting what's strong and weak in someone else's work, applied now to Discussions rather than papers (Week 5), intros (Week 9), JARS (Week 11), or Results/Analysis (Week 3). The three things we look at are:
  - Linking findings to the evidence base
    - i.e. where students link to the evidence base but only say if it agrees/disagrees, rather than going further

    - going further means explaining what the agreement or disagreement actually means: does it strengthen confidence in a theory, point to a boundary condition, or suggest a methodological difference, rather than just noting that the relationship exists
  - Limitations
    - including limitations that are irrelevant to the design (e.g. quant limitations for a qual project)
    - covering lots of different limitations but not going into depth
  - Implications
    - not linking to the evidence base in support
    - over-inflating the importance of the study
    - the Discussion is exactly the right place for future-facing claims about implications (unlike the Introduction, where we ask students to hold off on this). The caution here is about doing it in a supported way, not about avoiding it altogether

- I also (briefly) discuss with students the importance of situating their findings within the wider context (i.e. why is it important/does it link to theory etc.?).

9.1.3 Peer review of the Discussion section

- As students don't get feedback from supervisors on their Discussion sections, I discuss doing peer review with them.
- Either I can organise it or they can organise it within themselves (they usually self-organise along methods in some way (qual reading qual etc.))
- I provide them with a some guidance for completing feedback
- I suggest students use the same three lenses from the evaluation exercise above (linking to the evidence base, limitations, implications) as a concrete framework when reviewing each other's Discussions, rather than giving feedback with no particular structure to it
- Since students often self-organise with people they already know, it's worth reminding them that constructive criticism is more useful to a peer than reassurance, friends reviewing each other's work can be reluctant to say anything properly critical

9.2 Internal resources

Staff notes, tips and excerpts on Developing Evaluation in Discussions

Guidance on completing peer feedback for the Discussion

Resources on evaluation in Discussion sections (from RM2 ODL book) - see Chapter 7 on Academic Writing

9.3 External resources

Guidance from APA about what to include in a Discussion section

Phrasebank from Manchester University which students might find helpful as a starter, when discussing their findings

10 Semester 2 Week 7

Note: In 26-27, this session will be in Semester 2 Week 5 because the dissertation deadline is earlier than normal, due to the early Easter Bank Holiday in 2027

10.1 No-stakes presentations

In this session, I ask the students to come prepared to present five minutes on their findings. If they have results to present, they can summarise these. If they haven't completed their analysis, then they should present on what they've done so far and are planning to do.

This is the practice run I mention to students back in Semester 2 Week 1, ahead of the UG conference and BPS conference. Worth reminding students of that connection, so it reads as the promised rehearsal rather than a new, unconnected activity.

I then ask students to ask questions of each other, so that they can practice asking questions and the student presenting gets practice in responding to questions. This tends to take up the whole session, so I don't plan anything else alongside this.

I remind students of a couple of things from Semester 2 Week 1 before they start: thinking through their own study's weak points in advance so a tough question doesn't catch them off guard, and that it's completely fine to say they don't know or didn't look at something, rather than guessing. Since some time has passed since that session, a quick reminder just before presenting helps these actually get used.

To help the peer questions land, I use the same techniques from the Semester 1 Week 7 bullet-point intro presentations: giving each listener something specific to focus on rather than leaving it open with "any questions?", and asking students to jot down a line or two on each presentation even if they don't ask something aloud.

I roughly decide in advance how long each person gets for their 5 minutes plus questions, so time stays predictable and fair, rather than the first few presenters getting a long discussion and the last few getting rushed.

I also flag to students that it's completely normal at this point for progress to look uneven across the group, some will have full analyses, others will still be doing their analysis, and that isn't a sign of being behind. Comparing yourself to someone further along isn't a fair

comparison, in the same way we've discussed elsewhere that comparing an early draft to a finished, published paper isn't either.

I will also remind students about the peer review of the Discussion section if they haven't yet mentioned organising this concretely.

10.1.1 Expected progress

- By week 7, students will be around 2-3 weeks away from submitting
- I should have all Analysis/Results sections sent to me for feedback by now and make sure students are aware of the last date they can send me drafts (extenuating circumstances aside)
- If students haven't written up their Analysis sections, they should be almost finished

11 Semester 2 Week 9

Note: In 26-27, this session will be in Semester 2 Week 7 because the dissertation deadline is earlier than normal, due to the early Easter Bank Holiday in 2027

11.1 Last-minute questions

This session tends to be left as open for students to bring along questions. By this point, they are nearing the end of the process and they all have niggling questions that is then quite helpful to cover as a whole group.

As with Semester 2 Week 3, I ask students to post questions on Teams in advance where possible, so I can prepare properly. As before, I remind them that even a vague "I don't know where to start with X" is worth bringing, this matters even more here than in Week 3, since students this close to submission can be more reluctant to admit they're still unsure about something basic.

Even if nobody raises them, I make sure to cover a few common last-minute items myself: submission logistics (how and where to actually submit), formatting or word count requirements, marking criteria, whether appendices or consent forms need to be included, and reference list completeness. This is the same pre-empting approach I use for data collection, just applied to the administrative end of the process instead.

I also ask students more generally how they're doing at this point, not just what questions they have. This tends to be one of the more stressful points in the whole process, and it's worth checking in directly rather than only covering the academic content.

I don't prepare anything in advance for this, other than reminding the students on teams to come along with their questions. I will also remind them that we are going to do a practice presentation in the next session and confirm the details with them (place, day and time).

11.1.1 Expected progress

- By week 9, students would usually be around 1 week away from submitting
- All analysis sections should be submitted and feedback returned by now, unless there are students with extenuating circumstances.

- Students should have already done peer review for their Discussion if they are doing this, and should be working on the final edits.

12 Semester 2 Week 11

Note: In 26-27, this session will be in Semester 2 Week 9 because the dissertation deadline is earlier than normal, due to the early Easter Bank Holiday in 2027

12.1 Celebration and practice for the Undergraduate conference

This session is longer than usual - I usually book a room for two hours and schedule it for an hour and a half

This is the practice run with slides I mention to students back in Semester 2 Week 1, alongside the informal practice in Semester 2 Week 7.

- Mid-way through Semester 2, I will arrange a time that works for everyone and then book a room (Seminar room, Boyd Orr) to do live run-throughs of the talks for the L4 conference.
- We usually practice whichever format they will do at the conference
  - Some will do 10 min scientific talks, others 10 min informal talks (e.g. Pint of Science/Bright Club style).
  - If someone has a panel, I will run through some practice questions with them.
- Before each run-through, I remind students of the tip from Semester 2 Week 1 about preparing backup slides for questions they anticipate (not relevant for panel discussions). This is the last rehearsal before the real thing, so it's the point to check they've actually done this rather than just having heard the advice once, months earlier.
- I then give feedback on slides/pace/delivery etc. so that the students get some additional practice before the L4 conference itself.
- I also ask the rest of the group to give feedback on each other's run-throughs, using the same guidance given to students from the Semester 1 Week 7 bullet-point intro presentations: giving each listener something specific to focus on, and asking them to jot down a line or two even if they don't say something aloud. This keeps everyone engaged across the full session, rather than only half-watching until it's their turn.
- There is also a chance for the students to reflect on how far they've come over the year (I try to bring snacks in so they have a chance to celebrate). I try to name some of what they've actually built across the year as part of this, evaluating literature critically,

structuring an argument, handling feedback, presenting under pressure, so it's a concrete reflection rather than just a general "well done."

A Setting expectations for dissertation students

I provide some information for students before dissertation supervision starts, so that they know how I work as a supervisor, what they can expect from supervision from me, and also what my expectations are from them as supervisees.

This is my 2026-27 version; the Overview has older versions (for both undergraduates and Online Distance Learning PGTs)

A.1 Overview

Hello, and welcome to your dissertation! As you know, I'm Ashley and I'll be your dissertation supervisor this year.

Every dissertation project is different, and the way I tend to supervise is to focus on us working together (both you and I, and also us as a group with your peers) to support you to develop a range of skills, culminating in your dissertation write up. I tend to be quite structured as a supervisor, and this is one reason I developed this document, as it will outline the process for you in advance, so you know what to expect. If there is something you would like added to this sway, let me know and I'll see what I can do.

> ! Key dates for 26/27
>
> - Dissertation deadline: Friday 5th March (week 8)
> - UG conference: Friday 19th March (week 10)

A.2 Expectations

I have certain expectations in terms of how we will work together over the academic year. I have some below, but I would like you to think about whether there are any you would like to add, or if there is anything you want to amend related to the points below.

A.2.1 Communication

I ask that all students working with me communicate with me, letting me know if they are unable to make a certain deadline or if something gets in the way of a task they had planned for a specific point in time. In return, I will communicate with you regularly, including when you can expect feedback, and will do my best to let you know if I have to delay something beyond what I had previously communicated.

A.2.2 Attendance

I ask that all students attend group sessions unless there is something urgent that has come up. Individual sessions are more flexible and can be cancelled if you feel that you don't need to meet in a particular week (although please let me know in advance if this is the case). We can also change the time of an individual session if there is a clash with something, just let me know if so. Group sessions are held for 1h every fortnight, with individual sessions being 30 mins, held in the weeks that we are not meeting as a group.

A.2.3 Supportive space

I want the dissertation group to be an encouraging, safe, space and the dissertation process to be an enjoyable (albeit challenging at points!) experience for everyone. This means that you should never hesitate to ask any questions (all questions are valid) and I'd like us all to work together to support each other. No one is perfect and we will all make mistakes during the process (including me). I've been supervising for a while now and I haven't yet managed to come across anything that we have been unable to sort after some discussion, so don't worry about talking to me if something has gone wrong :).

A.3 Dissertation meetings

Dissertation meetings will be held every week, with individual meetings and group meetings alternating on a weekly basis.

Semester 1

- Group meetings (1 hour): Weeks 1, 3, 5, 7, 9, 11
- Individual meetings (30 mins): Weeks 2, 4, 6, 8, 10

Semester 2

- Group meetings (1 hour): Weeks 1, 3, 5, 7, (plus a 1.5h session for the conference in week 9)

- Individual meetings (30 mins): Weeks 2, 4, 6, 8

Meetings will be held in my office (Room 439, 62 Hillhead Street). I will send outlook invitations for all supervisions, so that they are all in Outlook calendars.

We may have to select a different time for Semesters 1 and 2, due to changes in timetables/teaching, but can revisit this nearer to the end of Semester 1.

Semester 1 group meeting time: TBC

Semester 2 group meeting time: TBC

A.4 Deadlines

We will set deadlines for you to submit the following: proposal, ethics, introduction, methods, results/analysis. I will ask you to work with me to set these deadlines so that we agree them together.

A.4.1 Ethics

We will prioritise the ethics application from the very start, the reason for this is that you cannot collect data unless you have your ethics approved, meaning that delayed applications can bring a project to a halt.

A.4.2 Dissertation

Dissertation section deadlines are not set in stone, I would much rather that you take an extra day or two if you need it rather than sending an unfinished draft (with the caveat that it will never be perfect). If this is the case, let me know and we can discuss options.

Although it is unusual for this to be an issue, there will be a point where I am no longer able to look over drafts before the deadline. We will aim for dates before this, but the absolute last date I can accept anything is **Monday 22nd February**. This is because it becomes very unlikely that I will be able to turn around feedback in time for you to be able to make meaningful changes by the submission deadline on Friday 5th March. The exception to this is if there are extenuating circumstances that have affected progress of the dissertation, and we would then discuss a suitable alternative.

A.5 Shared folders

I have set up a shared folder for each of you. Please save this and use this folder to store your work. You are welcome to add in additional folders etc. as you need to.

You can work on ethics/dissertation drafts elsewhere and then add in the versions that you want me to provide feedback on if you prefer. However, I ask that files for all data and analysis are kept in this folder throughout.

Each folder will have five main sub-folders: Proposal (where we will have a copy of the draft proposal), Ethics (where we will keep the Ethics drafts), Data (where the data you are working on will be), Analysis (where any files relating to your analysis will be) and Dissertation Drafts (where you will keep your drafts, or where you put your drafts for me to review).

Only you should be able to access your folder (feel free to try another person's link to test this, and let me know if you can access it!)

(Add each student's individual folder link here when sharing with your own cohort.)

A.6 Communication

I have set up a Teams with a couple of channels that you can access, I have a General one for all of my dissertation students and your Level 4 (26-27) one (which we will use most of the time).

All drafts to receive feedback, ethics documents and proposals should be added to the shared folder I have with you. Please message me to let me know when you've added something (I won't get alerted to it being added).

Most questions should be posted in the teams channel, if you have something that is personal and therefore not appropriate to be shared with the whole team, then it is okay to DM. I prefer DM on teams over email, as my email inbox is very difficult for me to keep on top of.

A.7 Feedback

A.7.1 When you can expect feedback

For ethics and the proposal, feedback will tend to be returned within a few days or a week. For dissertation section drafts, I will usually aim to provide feedback within two weeks. This is because drafts tend to be in semester 2, when I have most of my teaching. Depending on my teaching/marking commitments, this may take longer, but I will communicate with you about this at the time. You will also be able to see where you are in the 'feedback queue' in the shared deadlines document.

A.7.2 What type of feedback you will receive

I generally provide in-text comments, so that I can show you which part am I referring to in my feedback (where relevant). I will also give a global overview/summary. I will tend to focus on what can be improved, as this is the priority to help your writing develop. However, I will also let you know what you do well too.

A.7.3 How you can ask for specific feedback

If you have specific parts you would like feedback on (e.g. if you are unsure about something), feel free to leave any questions by commenting. I will then respond to these specifically when giving feedback.

A.7.4 What format should be sent for the drafts?

All documents (proposal, ethics, Intro, Methods, Results/Analysis) should be in Word. An exception to this is copies of standardised measures from someone else (this is fine in pdf).

A.8 Group sessions

In each session, there will be time for questions and we will also go round the group and see how everyone's project is going. We will also spend time discussing certain aspects of the dissertation, and I will provide resources as appropriate.

I have planned out the group sessions as follows (although these are subject to change if required):

Semester 1

- Week 1 - Getting to know each other, topics, proposals
- Week 3 - Ethics, research questions
- Week 5 - Summarising papers, writing, bullet point introductions
- Week 7 - Discussing the bullet point intros, participant recruitment, reducing perfectionism
- Week 9 - Collecting data, developing evaluation (intro)
- Week 11 - Structure (i.e. reverse outlines), JARS guidelines

Semester 2

- Week 1 - Receiving and applying feedback, presenting work
- Week 3 - Analysis (quant and qual) & developing evaluation (discussion), peer review

- Week 5 - No-stakes presentations - everyone will present a 5 min summary of study findings so far (these can be very rough and initial if you haven't completed analysis)
- Week 7 - Final group session - bring your questions
- Week 9 - Longer session: Celebration combined with practice talks for the UG conference/BPS conference

A.8.1 Individual sessions

Individual sessions are dedicated slots each fortnight for you. Here, we will tend to catch up on how your project is going, and you will have the opportunity to ask questions. These may be used more often at certain points in the year (e.g. getting ethics together) than others (e.g. once your data collection is all set up). Most people come along every week, but if you find one week that you don't need to meet, it's not an issue, just let me know and we can cancel it.

A.9 Peer review

I am not allowed to look at a draft of the Discussion section, so there will be the opportunity to peer review each others' discussion sections. We will discuss this in Semester 2, in the group sessions. I will provide some guidelines around peer review, and you can choose whether to take part or not. I am happy to set things up for you if you want, or can take a step back and you can organise within yourselves. Everyone who wants to take part must be included.

A.10 Future aspirations

I realise that some people dislike the 'what are your plans after graduation?' question, but I will ask you about this at some point during semester 1. I will most likely do this in individual supervision. The reason that I do it is so that I can see if there is anything I/your peers can do throughout the dissertation process to support your future plans. If you don't know what you want to do, this is also fine, but it is then about seeing if we can maximise development of your employability skills, which will then be helpful in whichever direction you decide to go in :).
